Tamoxifene e AD: interazioni (1)

Kelly et al.: **Selective serotonin reuptake inhibitors and breast cancer mortality in women receiving tamoxifen: a population based cohort study.**

BMJ 2010; 340:c693 doi:10.1136/bmj.c693

- le donne con un cancro al seno che assumono l'antidepressivo paroxetina contemporaneamente al trattamento con l'antiestrogeno tamoxifene avrebbero un maggior rischio di mortalità dovuta al tumore.
- Sembrerebbe inoltre che maggiore è la durata della sovrapposizione delle due terapie, maggiore è la probabilità di morte.
- Antidepressivi diversi, inclusi altri SSRI, non hanno invece mostrato alcun effetto in questo senso.

Tamoxifene e AD: interazioni (2)

- Kelly et al.: Selective serotonin reuptake inhibitors and breast cancer mortality in women receiving tamoxifen: a population based cohort study

BMJ 2010; 340:c693 doi:10.1136/bmj.c693

- l'equipe canadese ha esaminato le cartelle cliniche di quasi 25 mila donne al di sopra dei 66 anni, colpite da cancro alla mammella, che avevano iniziato il trattamento con l'antiestrogeno tra il 1993 e il 2005.
- Di queste, 7.500 avevano ricevuto anche un antidepressivo e **2.430** un unico AD durante la terapia con l'antiestrogeno.
- L'SSRI più prescritto era paroxetina (25,9%), seguita dalla sertralina (22,3%), citalopram (19,2%), venlafaxina (SNRI) (15%), fluoxetina (10,4%) e fluvoxamina (7,2%).

Tamoxifene e AD: interazioni (3)

- Kelly et al.: Selective serotonin reuptake inhibitors and breast cancer mortality in women receiving tamoxifen: a population based cohort study

BMJ 2010; 340:c693 doi:10.1136/bmj.c693

- Nel corso del follow-up, durato in media 2,38 anni, si sono avuti 1.074 decessi, di cui 374 dovuti al tumore al seno.
- L'analisi ha dimostrato un aumento del rischio di mortalità solo nelle donne che avevano assunto la paroxetina.

Tamoxifene e AD: interazioni (4)

- Kelly et al.: Selective serotonin reuptake inhibitors and breast cancer mortality in women receiving tamoxifen: a population based cohort study

BMJ 2010; 340:c693 doi:10.1136/bmj.c693

- L'assunzione di paroxetina per il 41% della durata del trattamento con tamoxifene porterebbe a un decesso aggiuntivo ogni 19,7 pazienti trattate entro 5 anni dall'interruzione dell'antiestrogeno,
- il rischio sarebbe ancora maggiore con una sovrapposizione più lunga

Tamoxifene e AD: interazioni (5)

Kelly et al.: **Selective serotonin reuptake inhibitors and breast cancer mortality in women receiving tamoxifen: a population based cohort study**

BMJ 2010; 340:c693 doi:10.1136/bmj.c693

- Questi risultati forniscono supporto all'ipotesi, già suffragata da precedenti evidenze, secondo la quale l'inibizione dell'isoenzima 2D6 del citocromo P450 (CYP2D6) possa influenzare negativamente l'outcome nelle donne con carcinoma mammario trattate con l'antiestrogeno.
- Il citocromo CYP2D6 è coinvolto nella trasformazione del tamoxifene in endoxifene, un metabolita con un'affinità 100 volte superiore per i recettori per gli estrogeni.
- Studi di farmacogenetica hanno evidenziato che le donne che metabolizzano poco il tamoxifene hanno livelli più bassi di endoxifene, al pari di quelle trattate con farmaci che inibiscono il CYP2D6.
- Farmaci che inibiscono CYP2D6 ostacolerebbero la trasformazione del tamoxifene in endoxifene

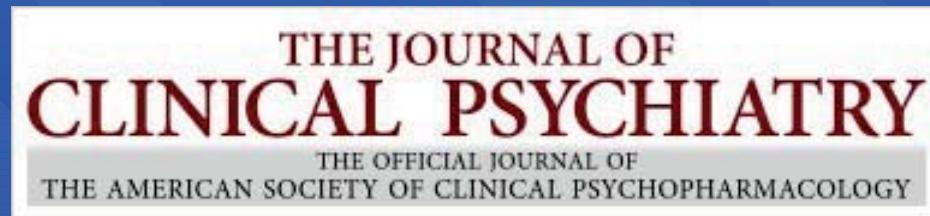

J of the Natural Cancer Institute 2003; 95: 1758-1764

FOCUS ON WOMEN'S MENTAL HEALTH

Interactions Between Tamoxifen and
Antidepressants via Cytochrome P450 2D6

Julie Eve Desmarais, MD, and Karl J. Looper, MD, FRCPC

Metabolismo del tamoxifene

Tamoxifene e AD: interazioni (6)

Andersohn et al: Interaction of serotonin reuptake inhibitors with tamoxifen. Avoid coprescribing paroxetine and tamoxifen in women with breast cancer

BMJ 2010;340:c783 doi: 10.1136/bmj.c783

- La raccomandazione dell'editoriale di commento allo studio è quella di evitare in queste pazienti gli AD che inibiscono fortemente il CYP2D6, come paroxetina e fluoxetina, e preferire invece inibitori meno potenti quali citalopram o venlafaxina

Interactions Between Tamoxifen and Antidepressants via Cytochrome P450 2D6

Julie Eve Desmarais, MD, and Karl J. Looper, MD, FRCPC

Table 4. Proposed Risk of Decreased Metabolism of Tamoxifen by Antidepressants Inhibiting the CYP2D6 Enzyme

Antidepressant	Degree of Decreased Tamoxifen Metabolism	Recommendations
Venlafaxine	Minimal	Use preferentially
Desvenlafaxine	Minimal, direct studies with tamoxifen lacking	Consider use based on risk-benefit assessment
Mirtazapine	Minimal, direct studies with tamoxifen lacking	
Citalopram	Mild	
Escitalopram	Mild, direct studies with tamoxifen lacking	
Sertraline	Moderate	
Fluvoxamine	Moderate, direct studies with tamoxifen lacking, moderate 3A4 inhibitor	
Duloxetine	Moderate, direct studies with tamoxifen lacking	
Nefazodone	Mild 2D6, direct studies with tamoxifen lacking, strong 3A4 inhibitor	
Paroxetine, fluoxetine, bupropion	Severe	Avoid use

Table 3. In Vitro Inhibitory Constants of Antidepressants for CYP2D6

Antidepressant/Metabolites	K_i μmol (or IC_{50})	Mean	Median	Reference
Citalopram	7–88 ($IC_{50} > 100$)	27.33	15	Otton et al, ³¹ 1993; Crewe et al, ⁴⁷ 1992; Yu et al, ⁴⁸ 2003; Skjelbo and Brosen, ⁴⁹ 1992; Belpaire et al, ⁵⁰ 1998; Hemeryck et al, ⁵¹ 2000
Desmethylcitalopram	1.3–31 ($IC_{50} = 70$ –80)	12.33	8.5	Skjelbo and Brosen, ⁴⁹ 1992; Otton et al, ³¹ 1993; Belpaire et al, ⁵⁰ 1998; von Moltke et al, ⁵² 2001
Escitalopram				
Fluoxetine	0.15–4.08 ($IC_{50} = 0.72$)	1.05	0.6	Otton et al, ⁵³ 1994; Otton et al, ³¹ 1993; Nielsen et al, ⁵⁴ 1996; Hemeryck et al, ⁵¹ 2000; Fogelman et al, ⁵⁵ 1999; Yu et al, ⁴⁸ 2003; Crewe et al, ⁴⁷ 1992; Hara et al, ⁵⁶ 2005; Belpaire et al, ⁵⁰ 1998; Skjelbo and Brosen, ⁴⁹ 1992; Ball et al, ⁵⁷ 1997; von Moltke et al, ⁵⁸ 1994; Verhoeven et al, ⁵⁹ 1996; Delbressine and Vos, ⁶⁰ 1997; Hemeryck et al, ⁵¹ 2000
R-fluoxetine	1.38			Stevens and Wrighton, ⁶¹ 1993
S-fluoxetine	0.22			Stevens and Wrighton, ⁶¹ 1993

DEPARTMENT OF MEDICINE

DIVISION OF CLINICAL PHARMACOLOGY

INHIBITORS

Inhibitors compete with other drugs for a particular enzyme thus affecting the optimal level of metabolism of the substrate drug which in many cases affect the individual's response to that particular medication, e.g. making it ineffective.

- A **Strong inhibitor** is one that causes a > 5-fold increase in the plasma AUC values or more than 80% decrease in clearance.
- A **Moderate inhibitor** is one that causes a > 2-fold increase in the plasma AUC values or 50-80% decrease in clearance.
- A **Weak inhibitor** is one that causes a > 1.25-fold but < 2-fold increase in the plasma AUC values or 20-50% decrease in clearance.
- All other inhibitors.

FDA preferred¹ and acceptable² inhibitors for in vitro experiments.*
